AutoDoc: Enhancing Documentation Efficiency in Software Engineering

Project Proposal by The Doc Doctors

RUDRA PATEL, FAROOQ KHAN, VIGNESH YAMPALLY, JOSH LEE, and THOMAS MCNAMARA

ACM Reference Format:

1 ABSTRACT

This proposal outlines the challenges associated with maintaining up-to-date documentation in rapid software development cycles. "AutoDoc" is introduced as an innovative solution that automatically generates and updates documentation for new code commits, facilitating better communication and collaboration within software engineering teams. This tool aims to improve software quality and developer efficiency by integrating seamlessly into the development workflow.

2 INTRODUCTION

In the fast-paced environment of software development, documentation often lags behind code changes, leading to decreased efficiency and increased risk of errors. The proposed solution, AutoDoc, addresses this gap by providing real-time, automated documentation for new commits, thus ensuring that project knowledge is preserved and easily accessible, enhancing overall team collaboration and project continuity.

3 RELATED WORK

Several tools and studies address aspects of automated documentation and testing within software engineering. Tools like Doxygen and Javadoc provide frameworks for documentation, while research into automated testing tools has sought to streamline quality assurance processes. However, AutoDoc differentiates itself by focusing on real-time documentation generation that adapts to rapid changes and promotes seamless team collaboration.

4 SOFTWARE ENGINEERING PROCESS

The selection of the Agile software engineering process for our project stems from its adaptive planning, evolutionary development, early delivery, and continual improvement, all of which foster flexible responses to changes. Agile is particularly advantageous for our project because it allows for incremental development, frequent reassessment, and adaptive planning that is essential in a fast-evolving field like software documentation. The iterative process will enable our team to integrate customer feedback early and often, ensuring that AutoDoc meets the real-world needs of its users. Furthermore, Agile supports small, cross-functional teams like ours, where frequent communication and collaboration are vital. The use of tools such as Git for version control, along with automated testing frameworks and continuous integration pipelines, will underpin our Agile practices, ensuring that our development process is as dynamic and responsive as the AutoDoc tool itself.
